February 24 - 28, 2019 - Athens, Greece

Making decision is a process that results for an actor, in a choice between two or more solutions to a given problems. The choice can concern conceptions, behaviors, and actions and be done by various actors, individuals or groups. The decision-making conditions and the actors involved may be of interest to spatial dimension, based on a fairly banal observation: the presence of "something" "somewhere" may imply that it has been decided in one way or another to implement this something here.

One can, therefore, say that there are "spatial decisions", and that trying to clarify their role is an important element for the geographical explanation.

Many techniques, approaches and methods exist for the geo-decisional processing. The most innovative are inspired from the Geo-processing science and Business Intelligence.

This special track integrates contributions giving study, experience, applications or other new approach highlighting a geo-processing aspect in a spatial decision making.

The topics encompass, but not limited to:

- Geo-decisional process
- Spatial datawarehousing
- SOLAP (Spatial Online Analytical Processing) applications
- Spatial decision and urban management
- Spatial data mining
- Geo-environment
